

“As a third generation Tasmanian fisherman, I’ve seen a big decline in fish stocks and have real concerns for the future. I love this place and want my grandkids to be able to enjoy the bounty of our oceans like I have.”

Bob Drysdale - Tasmanian Fisherman

Compared to 50 years ago fish numbers are down and our marine environment is under a lot of pressure. Marine pests, climate change, fishing and pollution are all putting increasing stress on our favourite places.

If we are to protect our fantastic lifestyle, our fishers’ livelihoods, and the wildlife and environment that provide our oxygen, food and climate control, we need to strike a happy balance between fishing like we’ve always done and conservation. It’s as easy as fishing responsibly, caring for our coasts and supporting marine national parks.

Protecting our oceans is common sense.
